Unintended Microbial Consequences of Routine Chlorhexidine Bathing
Dr. Mary Hayden, Rush University Medical Center, Chicago
The Denver Russel Memorial Teleclass Lecture

Chlorhexidine (CHX)

- Biocide
- In use since 1954 for skin antiseptis and other medical indications
- Binds to negatively charged microbial membrane
 - Low concentrations: Alteration of bacterial membrane integrity and cell osmotic equilibrium
 - High concentrations: Precipitation of cell contents and cell death
- Active against most bacteria and yeast
 - Activity varies by genera and species
 - Not active against mycobacteria, spores, viruses

3

Rationale for Routine CHX Bathing

- Potentially pathogenic microbes commonly contaminate/colonize skin of hospital patients
 - MRSA, *C. difficile*, *C. auris*, MDR-A. *baumannii*, carbapenemase-producing *K. pneumoniae*
- CHX binds to stratum corneum, prolonging effectiveness of antiseptis
- Reducing burden of these microbes on skin by CHX bathing has beneficial effects:
 - Fewer central-line associated bloodstream infections (CLABSIs)
 - Fewer contaminated blood cultures
 - Reduction in cross-transmission of MDROs
- Most studies conducted in ICUs
- Best data for MRSA, VRE

Policies for Controlling Multidrug-Resistant Organisms in US Healthcare Facilities Reporting to the National Healthcare Safety Network, 2014

Lindsey M. Weiner, MPH;¹ Amy K. Webb, MPH, CHES;¹ Maroya S. Walters, PhD, ScM;¹ Margaret A. Dudeck, MPH, CPH;¹ Alexander J. Kallen, MD, MPH¹

We examined reported policies for the control of common multidrug-resistant organisms (MDROs) in US healthcare facilities using data from the National Healthcare Safety Network Annual Facility Survey. Policies for the use of Contact Precautions were commonly reported. Chlorhexidine bathing for preventing MDRO transmission was also common among acute care hospitals.

Infect Control Hosp Epidemiol 2016;37:1105–1108

- Survey of 4,000 US hospitals and long-term care facilities participating in NHSN
- 63% of acute care hospitals and 49% of long-term care facilities used routine CHG bathing to reduce transmission of MDROs

Unintended Microbial Consequences of Routine Chlorhexidine Bathing

Dr. Mary Hayden, Rush University Medical Center, Chicago
The Denver Russel Memorial Teleclass Lecture

Potential Unintended Consequences of Routine Chlorhexidine Gluconate Bathing

- Reduced susceptibility to CHG or acquisition of antiseptic resistance genes
- Antibiotic cross-resistance
- Decolonization failure
- Unhealthy alteration in health-associated skin microbiome

Are there unintended microbial consequences of routine chlorhexidine bathing?

Babiker A et al Clinical Infect Dis 2020

7

Defining CHX Resistance

- Antibiotic resistance: Focus on inhibition of microorganism
- Biocide resistance: Focus on activity of drug
 - Post-exposure colony counts
- CHX resistance: Ability to survive exposure that kills rest of population
 - 1% - 4% CHG = 10,000 - 40,000 mg CHX/L

Horner C et al JAC 2012, 67:2547.

8

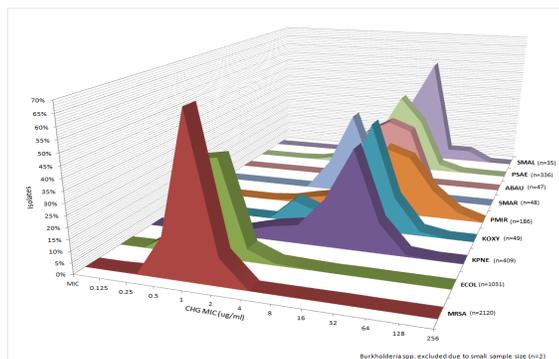

Unintended Microbial Consequences of Routine Chlorhexidine Bathing
Dr. Mary Hayden, Rush University Medical Center, Chicago
The Denver Russel Memorial Teleclass Lecture

No established, standardized method of testing for CHX resistance

- Phenotypic methods
 - Agar or broth macro/microdilution MICs/MBCs
 - Time kill assays
 - Post-exposure colony counts
 - Efflux over-expression
 - Epidemiologic cutoff
- Genotypic methods
 - Detection of efflux pump genes by PCR
 - *qacA/B, smr, norA/B, cepA, qacE*

9

CHX susceptibility of clinical bacterial isolates and concentrations of CHX detected on patients' skin after routine CHX bathing

- CHX concentrations applied to skin in clinical use = 2- 4% = 20,000- 40,000 µg /mL
- Concentration of CHX detected on patients' skin after routine bathing dependent on time since bathing and anatomic site
 - Median after bath, 312.5 µg/mL*
 - Range, 0 – 1250 µg/mL

Unintended Microbial Consequences of Routine Chlorhexidine Bathing

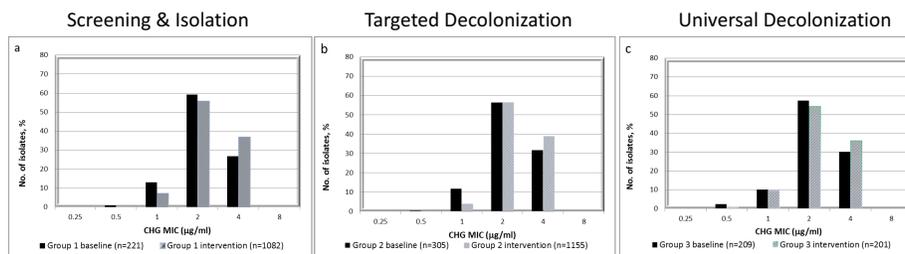

Dr. Mary Hayden, Rush University Medical Center, Chicago
The Denver Russel Memorial Teleclass Lecture

Secondary analyses of clinical trials data to evaluate the microbial effects of routine CHX bathing

Study Design	Population	Period of CHG exposure	Microbes Studied	Change in CHG Susceptibility?	Reference
Multicenter, cluster-randomized, nonblinded crossover study of CHX-impregnated washcloths vs soap & water bathing	7,727 patients in 9 ICUs and BMTUs in 6 US hospitals	6 months	713 MRSA 393 VRE	No change in CHX MIC ₉₀ for MRSA or VRE	Climo 2013
Multicenter, cluster-randomized trial comparing universal vs targeted vs screening & isolation	74,256 patients in 74 ICUs in 43 hospitals	18 months	3,123 MRSA	No change in CHX MIC ₅₀ /MIC ₉₀ or in <i>qacA/B</i> carriage	Hayden 2016
Community-based, cluster-randomized trial of every-other-day CHX cloth bathing vs soap & water bathing	10,030 soldiers	20 months	615 MRSA	No difference in <i>qacA/B</i> carriage	Schlett 2014

11

Distribution of CHX MICs among MRSA isolates from the REDUCE MRSA Trial (N=3173)

- Narrow distribution of CHX MICs
- No differences between arms or across time

Hayden MK et al JCM 2016

12

Unintended Microbial Consequences of Routine Chlorhexidine Bathing

Dr. Mary Hayden, Rush University Medical Center, Chicago
The Denver Russel Memorial Teleclass Lecture

Characteristics of MRSA isolates that carried *qacA* or *qacB* genes

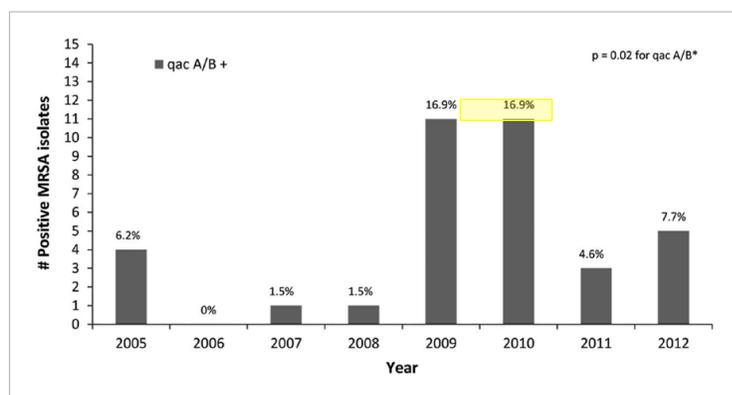

Hospital location	Intervention group	Study period	Culture type	<i>qac</i> identity	MLST	CHX MIC (mg/L)	CHX MBC (mg/L)	Mupirocin susceptibility profile
Florida	1	baseline	screen	<i>qacA</i>	ST8	4	4	S
Florida	1	intervention	screen	<i>qacB</i>	ST8	4	8	S
Florida	1	intervention	screen	<i>qacA</i>	ST2484	8	8	S
Texas	1	intervention	clinical	<i>qacA</i>	ST8	8	8	LL
Florida	3	intervention	clinical	<i>qacA</i>	ST450	4	16	HL

- 814 MRSA isolates tested for *qacA/B* by PCR
- 5 (0.6%) positive isolates

Hayden MK et al JCM 2016

13

Non-linear increase in *qacA/B* in MRSA isolates from anterior nares screening after introduction of routine CHX bathing

- Retrospective, single surgical ICU cohort
- 2005-2012
- Daily CHX bathing
- Non-linear increase in *qacA/B* detection in colonizing MRSA isolates over time

Warren D et al Infect Control and Hosp Epidemiol 2016

Resistant	1 (100.0)	0 (0)	1 (100.0)	0 (0)

Schlett C et al AAC 2014

17

Is reduced CHX susceptibility associated with decolonization failure?

- Report of CHX decolonization failure associated with *qacA+* epidemic MRSA strain ST239
 - Mean CHG MBC of epidemic strain 3X that of non-epidemic strains
 - Mean MBC epidemic MRSA strain: 78 mg/L
 - Mean MBC non-epidemic MRSA strains: 26 mg/L
- Case-control study found combination of *qacA/B* and LL-mupirocin resistance independent risk factor for MRSA decolonization failure.
 - OR 3.4 [95% CI, 1.5-7.8]

Differential association of bacterial and fungal taxa with CHX concentrations on of skilled nursing facility patients

- No association between CHX concentration and detection of *C. auris*

Proctor DM et al Nature Med 2021

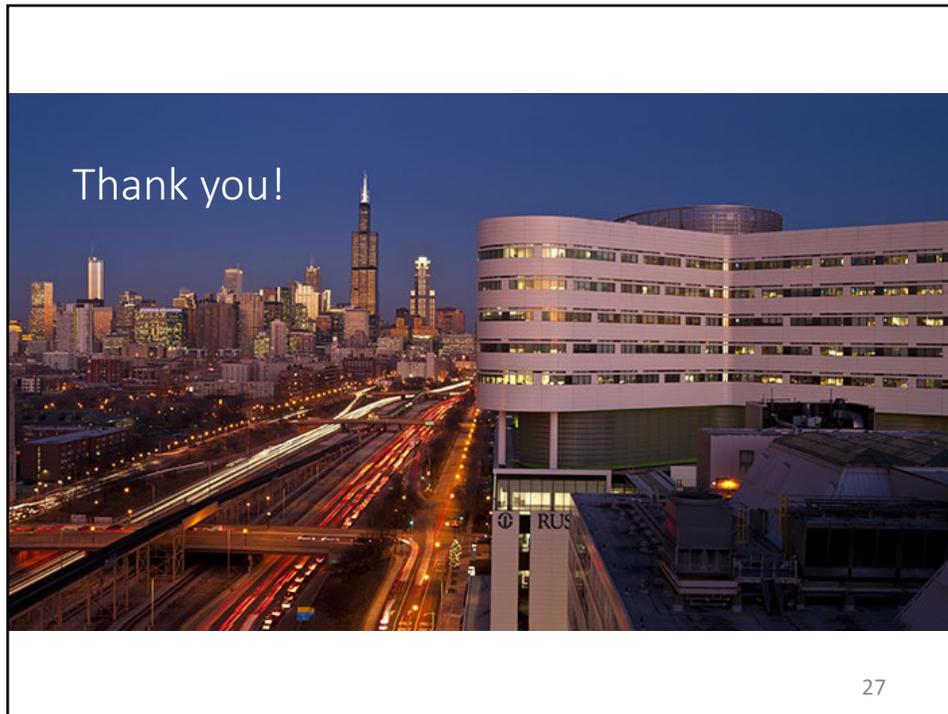

25

Conclusions

- Routine patient bathing with CHX has many demonstrated benefits
- The likelihood of clinically relevant reductions in microbial susceptibility to CHX resulting from routine CHX bathing is low
- Concerns for unintended microbial consequences of CHX bathing should not be a barrier to its use on patients for whom there is strong evidence for benefits of routine CHX bathing
- Gaps in knowledge remain, including how best to measure and monitor the effect of CHX on skin microbiota
