Cleveland, Ohio

Hosted by Martin Kiernan

Disclosures: Research support from Clorox and
Ushio America; Advisory board Ideate Medical

Transmission of healthcare pathogens

Objectives

- 1. To identify areas where empowerment of patients could enhance infection control and antimicrobial stewardship efforts
- 2. To review evidence that patient empowerment interventions can improve infection control practices and reduce healthcare-associated infections (HAIs)
- 3. To implement bundled measures that patients and families can use to reduce the risk for HAIs

Donskey CJ. Empowering patients to prevent healthcare-associated infections. Am J Infect Control 2023;51(11S):A107-A113. doi: 10.1016/j.ajic.2023.03.008.

Why are patient empowerment initiatives needed?

Patients often do not appreciate the risk for healthcare-associated infections and do not have adequate knowledge of actions they can take to prevent infections.

Hands, skin, and clothing of colonized patients can transfer pathogens

MRSA transfer from clothing of patients¹⁻⁴

1. Kanwar A. Contaminated clothing of MRSA carriers is a potential source of transmission. *AJIC* 2018;46:1414-16 (frequent transfer from clothing to hands of personnel and surfaces);
2. Pinto-Herrera NC. Transfer of MRSA by fist bump versus handshake. *ICHE* 2020;41:962-964 (22% vs 16%);
3. Alhmidi H. Transfer of MRSA by fist bump vs elbow bump. *ICHE* 2023;44:319-321;
4. Li DF. LTCF residents with MRSA carriage disseminate MRSA and viral surrogate markers to surfaces outside their rooms. *ICHE* 2021;42:1018-19.

Are my family members at risk to
acquire MRSA (C. diff, C. auris,
VRE) from me?

**Patients are often unaware of the
risks associated with devices,
antibiotics, procedures**

Patients not informed that urinary catheters increase risk for UTI

Surveys of patients with short-term urinary catheters

	Cleveland (2012)	U. Wisconsin (2016)
Catheters cause significant discomfort	35%	50%
Informed of increased UTI risk	47%	35%
Aware catheters are overused in hospitals	11%	-

Greer S. Survey of patients' knowledge and opinions regarding the use of indwelling urinary catheters. Infect Control Hosp Epidemiol 2011;32:174-6; Safdar N. Patient perspectives on indwelling urinary catheter use in the hospital. Am J Infect Control. 2016 1;44:e23-4.

An 80-year-old woman develops bacteremia due to a PICC line maintained unnecessarily for 3 weeks

Anderson M. Are hospitalized patients aware of the risks and consequences of central line-associated bloodstream infections? *AJIC* 2013;41:1275-7 (only 22% of patients with central lines recalled that a provider discussed the risk of infection).

Patients not aware that antibiotics pose a risk for *C. difficile* infection (CDI)

- Healthy 35-year-old developed CDI after receiving clindamycin for a root canal
 - Dental guidelines: Prophylaxis not recommended; clindamycin should be avoided
- “No one told me that I could get C diff from clindamycin”

ADA. Oral health topics: Antibiotic prophylaxis prior to dental procedures. ADA website. 2020. <https://www.ada.org/en/member-center/oral-health-topics/antibiotic-stewardship>.

Suda KJ. Use of Antibiotic Prophylaxis for Tooth Extractions, Dental Implants, and Periodontal Surgical Procedures. Open Forum ID 2017; 3. Gross AE. Serious antibiotic-related adverse effects following unnecessary dental prophylaxis in the US. ICHE 2021;42:110-12

Patients not aware that oral hygiene may reduce risk for pneumonia

- Most common HAI (pneumonia)
- Pathogenesis: Oral colonization --> aspiration
- Daily toothbrushing reduces hospital-acquired pneumonia

Ehrenzeller S. Association Between Daily Toothbrushing and Hospital-Acquired Pneumonia A Systematic Review and Meta-Analysis. JAMA Intern Med 2025.

Patients often receive inadequate instructions

- 26% of surgical patients did not receive instructions on chlorhexidine (CHG) bathing
- Neck often negative for CHG (Instructions: apply from neck down)
- Instructions modified

Colorimetric assay for CHG

Supple L. Chlorhexidine Only Works If Applied Correctly: Use of a Simple Colorimetric Assay to Provide Monitoring and Feedback on Effectiveness of Chlorhexidine Application. ICHE 201;36:1095-7; Donskey CJ, Deshpande A. Effect of chlorhexidine bathing in preventing infections and reducing skin burden and environmental contamination: A review of the literature. AJIC 2016;44: 5 Suppl:e17-21; Use of a simple colorimetric assay to provide monitoring and feedback on adherence to chlorhexidine bathing protocols. AJIC 2020;48:469-470.

Education of patients with *C. difficile* infection (CDI) is suboptimal

Education topic	% of patients who agree that education was provided	Recommended
How to clean your home	43%	Use bleach or another sporicidal disinfectant
How to clean your hands	62%	Soap and water
What to do if given an antibiotic prescription	13%	Consult primary provider
Whether to take a probiotic	13%	Unclear benefit

DeBenedictus CM. What is the current state of patient education after CDI? Infect Control Hosp Epidemiol 2020;41:1338-40.

Confusion about products

Patients not aware of when *C. diff* testing is indicated

- Interviews of patients tested for *C. difficile*
- Patients often reported diarrhea without meeting criteria for testing (≥ 3 unformed stools/24 h)
- Education could empower patients to participate in efforts to reduce inappropriate CDI testing

Patients not aware that hospital floors pose a risk for acquisition of pathogens

Hospital socks

Sock print (MRSA)

Call button on floor

Deshpande A. Are floors an underappreciated reservoir for transmission of health care-associated pathogens? *AJIC* 2017;45:336-338; Galvin J. Patient shoe covers: transferring bacteria from the floor onto surgical bedsheets. *AJIC* 2016;44:1430-2; Mahida N, Boswell T. Non-slip socks: a potential reservoir for transmitting multidrug resistant organisms in hospitals? *J Hosp Infect* 2016;94:273-5 (VRE recovered from 85% of socks and MRSA from 9%).

Hospital floors rapidly become contaminated when personnel enter the room

Redmond SN. Timing and route of contamination of hospitalized patient rooms with healthcare-associated pathogens. *Infect Control Hosp Epidemiol* 2021;1-6.

Hospital socks acquire pathogens when patients walk on the floor

Redmond SN. Timing and route of contamination of hospitalized patient rooms with healthcare-associated pathogens. *Infect Control Hosp Epidemiol* 2021;1-6.

Pathogens are transferred from socks to bedding, hands, high-touch surfaces

Redmond SN. Timing and route of contamination of hospitalized patient rooms with healthcare-associated pathogens. *Infect Control Hosp Epidemiol* 2021;1-6.

Evidence that patient
empowerment interventions can
improve infection control
practices and reduce HAIs

Empowering patients to improve personnel hand hygiene

- “Partners in Your Care”¹
 - Patients ask personnel if they have washed their hands
- Evaluation at Cleveland VA²
 - Only 3% reminded personnel
 - 100% displayed a sign
- Healthcare system³
 - Anonymous monitoring by patients and visitors

McGuckin M. Patient education model for increasing handwashing compliance. AJIC 1999;27:309-14; Lent V. Evaluation of patient participation in a patient empowerment initiative to improve hand hygiene practices in a VA medical center. AJIC 2009;37:117-20; Auld D. Patient and Visitor Engagement in Improving Healthcare Personnel Hand Hygiene: A Multihospital Pilot Program. Am J Infect Control 2025 Dec 8:S0196-6553(25)00741-2.

Engaging patients in stewardship can reduce inappropriate antibiotic use

- Of 73 patients receiving fecal microbiota transplantation (FMT), 25 (34%) consulted their FMT physicians regarding 43 antibiotic prescriptions
 - 26 (60%) deemed unnecessary
 - 7 (16%) necessary but alternative suggested
- 95% of recommendations followed

Hecker MT, et al. Fear of failure: Engaging patients in antimicrobial stewardship after fecal microbiota transplantation for recurrent CDI. ICHE 2017;38:127-129

Empowering patients to prevent HAIs

Donskey CJ. Empowering patients to prevent healthcare-associated infections. *Am J Infect Control* 2023;51(11S):A107-A113. doi: 10.1016/j.ajic.2023.03.008.

Surgical patient engagement to reduce surgical site infections

- Expert panel recommendations ¹
 - Pre-op - *S. aureus* screening, pre-op bathing, hair removal, smoking, diabetes management
 - Intra-op – body temperature, diabetes
 - Post-op - hand hygiene, wound care
- Patient engagement improves chlorhexidine bathing ²⁻³

Avoid PPIs: gastric acid provides an important host defense

Stiefel U. Suppression of gastric acid production by PPI treatment facilitates colonization by VRE and *K. pneumoniae* in mice. AAC 2006;50:3905-7; Nardino RJ. Overuse of acid-suppressive therapy in hospitalized patients. Am J Gastr 2000;95:3118-22.

Engaging high-risk patients to prevent sink drain and other water-associated infections

Room #: _____ RN Name: _____ Date: _____

Reliability Confirmation: Infection Prevention K-CARD (PATIENT USE): Splash Zone

This K-Card will be completed every shift.

This K-Card should be completed BY the patient. If patient unable or unwilling, complete with a peer RN.

Completed with patient or peer RN? PATIENT ☐ RN ☐

YES	NO	N/A	Choose "YES" or "NO" for the following questions.	Comments
			<u>ONLY</u> items used for peri-care (i.e. wipes, creams, etc.) are stored in the bathroom. <i>If NO: List the items in Comments.</i>	
			There are <u>NO</u> items on the counter near the room sink. <i>If NO: List the items in Comments.</i>	
			The sink in the room is being used for handwashing <u>ONLY</u> .	
			There are <u>NO</u> IV bags or tubing sets hanging near the sink.	
			Oral care is <u>NOT</u> being performed at the sinks (using basin).	
			Sterile water is being used for tooth-brushing (not tap water).	
			<u>NOTHING</u> is being rinsed down the sink drains except for oral care solutions, soap, and water.	
			The toilet lid is being put down when flushing.	
			The shower is running for 20 seconds before being used.	
			The central line dressing is staying dry when bathing.	
			The sinks are draining completely, at an appropriate rate. <i>If NO: Place a Facilities Work Order.</i>	
			The patient/caregiver(s) verbally verify that CHG is being used for daily bathing (if applicable).	
			The patient/caregiver(s) can explain how these interventions help prevent infection.	
			The RN & CNA feel competent explaining how these interventions help prevent infection.	

(front)

Definitions and Descriptions

These are the definitions and descriptions for the questions on this K-Card.

Question	Definition/Description
<u>ONLY</u> items used for peri-care (i.e. wipes, creams, etc.) are stored in the bathroom. <i>If NO: List the items in Comments.</i>	All patient supplies and personal items should be stored in locations that are away from the sinks so they do not become contaminated by water splashing out from the drains. Per the CDC, items should be 1m away from sinks. (Wipes or other perineal care items can remain in the bathroom.)
There are <u>NO</u> items on the counter near the room sink. <i>If NO: List the items in Comments.</i>	
The sink in the room is being used for handwashing <u>ONLY</u> .	It is important to limit the amount of time that patients and others are spending over the sink in the Splash Zones, but handwashing for infection prevention remains the priority.
There are <u>NO</u> IV bags or tubing sets hanging near the sink.	No IV bags or tubing should be hanging over the sinks where they can easily become contaminated by any splashes from the drains. This includes patient rooms and the med room.
Oral care is <u>NOT</u> being performed at the sinks (using basin).	It is important to limit the amount of time that patients and others are spending over the sink in the Splash Zones.
Sterile water is being used for tooth-brushing (not tap water).	Due to concern that the sink faucet may be contaminated with splashing water from the drain, it is important to avoid ingestion during oral care. As well, it is important to limit the amount of time that patients and others are spending over the sink in the Splash Zones.
<u>NOTHING</u> is being rinsed down the sink drains except for oral care solutions, soap, and water.	No beverages, body fluids, saline, dialysate, IV fluids, etc. are to go down the drain. These liquids create an environment for bacteria to grow in the drains. If you need to dispose of bio-waste, use the toilet.
The toilet lid is being put down when flushing.	Put the lid down on toilets and cover hoppers when flushing to. Avoid using the sprayers unless necessary. Turn down the flow as low as possible.
The shower is running for 20 seconds before being used.	Running the shower clears the hose of any water that has been sitting over time. Stagnant water creates a breeding environment for bacteria.
The central line dressing is staying dry when bathing.	It is important that your dressing remains dry and intact in order to prevent central line infections. If your dressing is getting wet, it is important that we identify alternative ways to keep it dry.
The sinks are draining completely, at an appropriate rate. <i>If NO: Place a Facilities Work Order.</i>	If the sink is backing up or slow to drain, this should be elevated <u>immediately</u> to the staff. Slow drainage or clogs can distribute organisms from the drain biofilm into the sink basin, increasing the risk of infection and contamination.
The patient/caregiver(s) verbally verify that CHG is being used for daily bathing (if applicable).	CHG bathing is an evidence-based way to prevent infections.
The patient/caregiver(s) can explain how these interventions help prevent infection.	This teach-back step is critical for patient understanding.
The RN & CNA feel competent explaining how these interventions help prevent infection.	It is important that our staff can verbalize the importance and rationale for these interventions.
