Overview:

- ***Clostridium difficile;***
unique characteristics
- ***Environmental issues***
- ***Toilets, commodes and bedpans***
- ***Bedpan washers***

Clostridium difficile -
associated diarrhea (CDAD)

Multi-hit Disease:

- **Toxigenic *C.difficile***
- **Imbalance in normal GI flora**
- **Host factors**

Disease range:

- **asymptomatic carriage**
- **diarrhea; colitis**
- **PMC (pseudomembranous colitis)**
- **Toxic Megacolon (surgical emergency)**

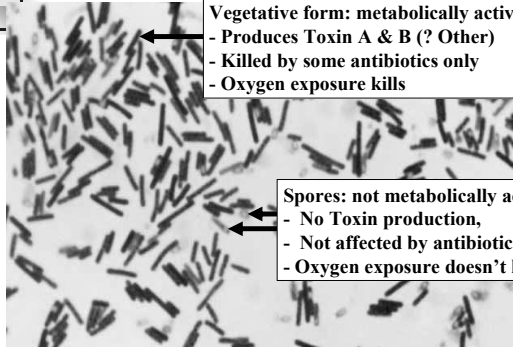

Clostridium difficile Update

C.difficile: Vegetative vs Spore

Vegetative form: metabolically active

- Produces Toxin A & B (? Other)
- Killed by some antibiotics only
- Oxygen exposure kills

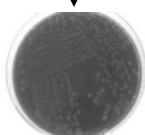

Spores: not metabolically active

- No Toxin production,
- Not affected by antibiotics
- Oxygen exposure doesn't kill

Spores versus Vegetative form of *C.difficile*

Culture for *C.difficile* from Stool specimens:
Alcohol or Heat Shock:
 kills all vegetative bacteria, spores survive and produce colonies on agar medium

CDMM culture of *C.difficile*

Impact of Spore characteristics

- **Alcohol hand hygiene**
 - CDC recommendations; soap and water
 - Alcohol does kill vegetative *C.difficile* but does NOT kill spores
- **Heat treatment**
 - Thermal decontamination: make item safe to handle and safe for next patient use
- **Disinfectant treatment:**
 - Often needs substantial contact time
 - Formulation (concentration) dependant

**Provincial Infectious Disease
Advisory Committee (PIDAC)**

- Contact precautions
- Hand hygiene: soap and water
- Room cleaning (twice per day)
- If ongoing transmission → consider hypochlorite (after routine cleaning)
- After 48 hours without diarrhea → may stop isolation precautions
- Do not perform "test of cure"

**Environmental Reservoirs of
C.difficile Spores**

- **Current guidelines (Health Canada):**
 - Clean with regular detergent
 - No need to use disinfectant
 - Emphasis on physical action
- **PIDAC (Ontario):**
 - Ongoing CDAD transmission → consider hypochlorite use (after routine cleaning)
- **Bedpans: Thermal treatment**
 - Bedpan washers; 80°C for 1 min; ISO 15883
 - steam sterilization

Patient Room: Toilet

- **High frequency of spores in toilet environment of CDAD patients**
- Published Studies evaluating Bleach:
 - 1) Bleach: Has been accepted as effective intervention - however, 500 ppm to 1000 ppm not effective (1:10 dilution of 5% household bleach = 5000ppm)
 - 2) Wilcox 2005; Suboptimal conc of cleaners and disinfectants may stimulate spore production
 - 3) Wilcox J. Hosp Infect 2003: 1000 ppm concluded bleach effective – but data did NOT show any difference in environmental load of spores
- Lab tests: 5000 ppm bleach effective at killing *C.difficile* spores rapidly (within 1-2 minutes).
- Bleach at 5000 ppm; fumes → workplace hazard

Clostridium difficile Update

Summary: Bleach

- Used in Quebec outbreak;
 - workplace safety issues
 - thought to be helpful
- Published Data → not convincing
- Recent study suggests CDAD outbreaks can be controlled without use of bleach
(Tomiczek Healthcare Quarterly 2006)

Accelerated H₂O₂

- Effective against *Clostridium difficile* spores:
 - 7% formulation; 10 minutes
- What is optimal formulation?
- Workplace safety concerns for some formulations
- Tomiczek et al in Healthcare Quarterly 2006; used AHP rather than bleach

Toilets, Commodes and Bedpans: What to do??

Clostridium difficile Update

Dr. Michelle Alfa, Winnipeg

Sponsored by ARJO www.arjo.com

Bedpan Reprocessing

- Patient use:
 - Who empties and cleans bedpan?
 - Is bedpan just rinsed with water?
 - Where does the bedpan get stored?
- After CDAD patient discharged:
 - does bedpan go to CPD for reprocessing and sterilization?

Ward Bedpan washers versus "sprayer and sluice"

- Aerosols; sprayer and sluice major problem
- Is Bedpan wash cycle adequate to eliminate *C.difficile*?

Bedpan washer efficacy data

- Current standard: Visibly clean
- Rodac samples of bedpans post-cycle (plastic vs stainless steel)

NOTE: CPD-WD Dry cycle was 116°C for 7 mins

Clostridium difficile Update

C. difficile in stool in sealed vial exposed to Bedpan washer cycle

□ CPD-WD (wash & dry) ■ Ward-WD (wash) ▨ CPD-WD (wash only)

Thermal Treatment: Efficacy of spore killing

Summary:

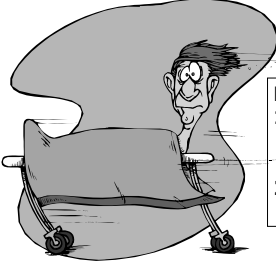

- *C. difficile* spores: reservoir for transmission
- Bleach; rapid killing of *C. difficile* spores
? efficacy on wards, workplace safety issues
- AHP; need more ward data, formulation dependant, some concentrations workplace safety issues
- Bedpan washers;
 - reduces aerosols
 - ? thermal conditions re: *C. difficile* spores
 - ISO 15883 recommends; 80°C 1 minute, manufacturer's compliant – no sporicidal claims

C. difficile in Healthcare Environment is a "Moving Target"!

Focus on:

- 1) "Religious" Attention to Housekeeping Cleaning Compliance
- 2) "Fecal Patrol" → Bedpans, commodes, toilets
